Summary

A brief description of major extensions in this version is provided. New functionalities & improvements are thoroughly presented along with the necessary user guidelines and examples.

Entersoft ERP

- **Minor improvements**

Entersoft ERP

Fixed assets

The method that the totals are calculated has been changed when the **Summary per Main Fixed Asset** parameter is defined in the **Detailed Fixed Asset Registry** report. Specifically, in this case only the values of the main fixed assets are taken into account for the calculation of both the grouping and the generic totals.

Documents

Henceforth, when the **Delete Quantity Matchings** action is executed, which is available on purchases and sales document lists, a confirmation message is shown in order to avoid unintentional execution.

Inventory items

- The item **Measurement unit** of the main supplier has been added to the available fields listed on the Inventory Item entity.
- The **Message with excess option** has been removed from the customization of Inventory Item - Control Policy, since it was not supported.

If this option is used, after upgrading to this version then the option will be changed to **Prohibition**.

The change refers to the following control policies:

- Control method - Stock Balance (Basic MU)
- Control method - Stock Balance (Alt. M.U.)
- Check season
- Check for item duplicate entries

Data interchange

The port of EAS that servers the Data interchange can be defined through the new **Enable on server** option that has been added to the control table or through the XML element **SentinelPort** in CSDataInterchange.xml. When the parameter is empty then the EAS used for the data interchange customization is used.

Entersoft CRM

Task types

Hence, items of **Package Materials** type can be defined in the item filter of used in the task type customization.
