New Features & Functionality (Outline)

This document aims to report the new features and extensions of EBS Version 4.0.24.4. First, the newly added functionality and features are briefly listed and, then, a detailed presentation follows. User guidelines and examples are provided where necessary.

Entersoft framework

- An alternative user authentication method is henceforth available.

1. Entersoft ERP

1.1 Calculation of shipping costs

For the shipping cost calculation you can use the new functionality of enforced calculation of zero shipping value. This is rather useful in cases when special terms necessitate the exemption of shipping costs, e.g. in case of a special offer. This functionality completes the existing functionality of not charging shipping costs when the total value of the document items exceeds a specified amount.

In order to calculate the zero shipping costs, it is simply required to activate the new field: **Free shipping** on the document header. This field can be activated either manually or using an automation or a field property profile that may describe the conditions under which free shipping is applicable.

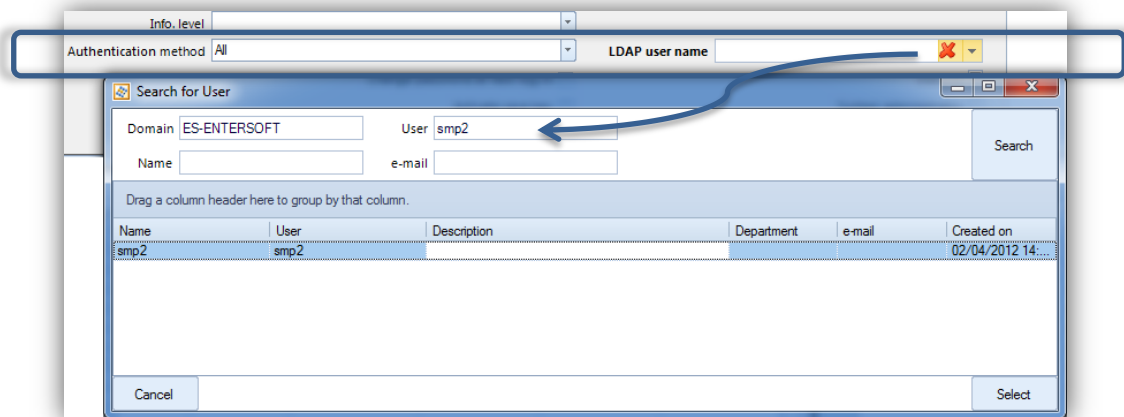

2. Entersoft framework

2.1 User authentication

A new alternative user authentication method is now available for application login, incorporating the **LDAP** (Lightweight Directory Access Protocol). This way it is henceforth feasible to utilize the predefined user authentication of a Company's **Domain Server** for user login into the Entersoft Application. This way does not substitute the existing login method: the login screen henceforth includes the option to login using one of the following authentication methods:

- Basic
- Network
- All

The available login methods are defined on the **Authentication method** field on the User administration UI form.

Next, it is required to select the **LDAP user** to which the application user corresponds to. The modal window allows you to search for the user in the Domain, using various search fields.

On the login screen the user can select whether (s)he wishes to login using the existing, basic method or the new method based on the network credentials. Assuming that the network authentication is allowed for the specific user, then (s)he will be automatically authentication without entering his/her credentials.
